Scrubgnome — Audacity Add-ons: Install & Use

Two free add-ons that find aircraft flyovers in a recording so you can see or hush them. They work inside **Audacity**, the free audio editor (https://www.audacityteam.org).

- **Label Jet Flyovers** — marks each flyover with a label (changes nothing).
- **Jet Flyover Suppressor** — lowers the volume during each flyover.

Both only *detect and dim* flyovers. For the full privacy scrub (stripping the inaudible tones and the hidden tags), use the Scrubgnome app itself.

Before you start — get your clip into Audacity

Audacity can't open a phone `.mp4` on its own without extra setup, so give it a plain audio file instead:

1. Open the Scrubgnome app (**Launch Scrubgnome**).
2. **Load file** → pick your clip.
3. Click **Export WAV for Audacity**. The `.wav` lands in your **Cleaned videos** folder.
4. In Audacity, **File ▸ Open** that `.wav`.

(You can also open any `.wav`, `.mp3` or `.flac` you already have.)

Part 1 — Install the plug-ins

The two files you need are in this folder: `Label Jet Flyovers.ny` and `Jet Flyover Suppressor.ny`.

Copy them into Audacity's **Plug-Ins** folder:

Windows 1. Press `Win + R`, paste this, and press Enter: `C:\Program Files\Audacity\Plug-Ins` 2. Copy both `.ny` files into that window. (If Windows asks for permission, click **Continue**.)

macOS 1. In Finder, press `Cmd + Shift + G` and paste: `~/Library/Application Support/audacity/Plug-Ins` 2. Copy both `.ny` files into that folder.

Linux Copy both `.ny` files into one of these (whichever exists): `~/.audacity-files/plug-ins` or `/usr/share/audacity/plug-ins`

Part 2 — Turn them on in Audacity

1. Open (or restart) Audacity.
2. Go to **Tools ▸ Plugin Manager...** *(older versions: Tools ▸ Add / Remove Plug-ins).*
3. In the list, find **Label Jet Flyovers** and **Jet Flyover Suppressor**.
4. Select each one and click **Enable**, then **OK**.
5. Restart Audacity once more if the menus don't update.

You only do this once. After that they live in Audacity's menus.

Part 3 — Find the flyovers ("Label Jet Flyovers")

1. Open your clip and **select the whole track** (`Ctrl + A`, or `Cmd + A` on Mac).
2. Go to the **Analyze** menu ▸ **Label Jet Flyovers...**
3. Adjust the settings if you like (defaults are a good start — see below), then **OK**.
4. A **label track** appears under your audio with a `flyover` marker on each pass it found. Click a label to jump to that spot and listen.

Nothing is changed — this just shows you where the planes are. If it finds nothing, lower the **sensitivity** number and run it again.

Part 4 — Hush the flyovers ("Jet Flyover Suppressor")

1. Select the whole track (`Ctrl + A`), or just the part you want treated.
2. Go to the **Effect** menu ▸ **Jet Flyover Suppressor...**
3. Set how much to duck and how smoothly (see below), then **OK**.
4. Audacity lowers the volume during each detected flyover. Press **Space** to listen; **Ctrl + Z** undoes it if you want to retry with different

settings.

It's a broadband duck, so it dims *everything* while the jet passes — start gentle and nudge up.

The settings (both plug-ins)

Setting	What it does	Start at
Flyover sensitivity (dB above baseline)	lower = catches fainter/more flyovers	4
Minimum flyover length (seconds)	ignores short low-frequency blips	2
Low/high split frequency (Hz)	where the "low rumble" band ends; drop toward 150–250 if voices trip it	500
Reduction (dB) *(suppressor only)*	how much to lower the flyover	12
Fade in/out (seconds) *(suppressor only)*	how smoothly the duck comes and goes	0.5

How it decides: a flyover is a **swell** of low-frequency sound that rises above the clip's normal level and stays up for a couple of seconds. Steady low sounds (a bass note, a fan) don't trip it — only rises do. Defaults are a starting point, not a guarantee; tune them on your own audio.

Troubleshooting

- **The plug-ins aren't in the menus.** Re-check the Plug-Ins folder path, then enable them in **Tools ▸ Plugin Manager** and restart Audacity.
- **"Label Jet Flyovers" found nothing.** Lower the sensitivity (try 2–3), and make sure the whole track is selected.
- **It flags voices or music, not planes.** Lower the split frequency toward 150–250 Hz so only deep rumble counts.
- **The duck is too strong / too obvious.** Lower the Reduction dB, or raise the Fade in/out seconds for a gentler come-and-go.
- **Can't open your `.mp4`.** Use **Export WAV for Audacity** in the app first (see the top of this page).
